**ABSTRACT**

The present communication deals with the population dynamics of cestode parasite in Beed. Population of the cestode parasites are divided into three genera i.e. Cotugnia, Raillitina and Valigora. After dissecting intestine of *Columba livia* cestode parasite found are *Cotugnia meggitti* (Yamaguti) 1935, *Cotugnia columbae* (Shinde) 1969, *Raillitina tetragona* (Mohan) 1958, *Raillitina corvine* (Shinde) 1977, *Valigora mutabilis* (Linton). The present study includes application of statistical method to understand and distribution of some cestode parasites both minimum and maximum population level for three seasons i.e. summer, rainy and winter during 2017-2018.

*Columba livia* are collected from different sites of Beed district. The Parasites were collected from the intestine of the host. Cestode parasites were preserved 4% formalin and stained with Harris' haematoxyline. Then parasites are washed with distilled water and dehydrated with ascending grades of alcohol and mount in D.P.X. This study of population dynamics show the five cestode species of three genera which are *Cotugnia*, *Raillitina* and *Valigora*.

**Formulae**

$$\text{Incidence of Infection} = \frac{B}{A} \times 100$$

**A**

$$\text{Intensity of Infection} = \frac{C}{A}$$

**B**

$$\text{Density} = \frac{C}{B}$$

**A**

The A stands for the number of host examined, B for number of host infected and C for number of parasite collected.

Table I and II show the distribution of infection, density and index of infection.

**Table showing values of *Cotugnia* species**

Month	No. of host Examined (A)	No. of host infected (B)	No. of Parasites Found (C)	Incidence of infection (%)	Intensity of infection (%)	Density	Index of Infection (%)	Region
March 2017	15	05	02	33.33	0.4	0.1	0.04	Beed
April 2017	15	04	04	26.66	1	0.2	0.07	Georai

#### RESULTS AND DISCUSSION

**Genus *Cotugnia*:** In case of *Cotugnia* the values of incidence, density and Index of infection were maximum in rainy season and low in winter season.

**Genus *Rullitina*:** In case of *Rullitina* values of incidence, density and Index of infection were maximum in rainy season and restrained in winter season.

**Genus *Vallipora*:** In case of *Vallipora* values of incidence, density and Index of infection were maximum in summer season, restrained in rainy season and low in winter season.

Above data reveal that Cestode belonging from the genus *Cotugnia* are dominant. It is due to the host specificity and many other phonological factors.
